Our project uses several sensors to classify the type of trash. The final sensing method uses an Arduino board and an ESP-32 camera to implement a machine learning program that detects garbage and displays its category.

We first created a Python program that classifies images of several categories of trash using PyTorch. We imported a dataset from Kaggle containing six classes of waste: cardboard, glass, metal, paper, plastic, and landfill trash. We decided to remove the landfill class as we only looked for recyclable trash. The dataset contained 2390 images (without the landfill category). The images are all colored, and they are all sized 512 x 384 pixels. We resized all the input images to 256 x 256 pixels in the data preprocessing step. A good batch of 32 photos looks like the following:

We then divided the dataset into a train, validation, and test set. The ratio of those sets was 6:2:2, resulting in 1434 images for training, 478 images for validation and testing.

We implemented the pre-trained ResNet50 from one of PyTorch's pre-built architectures regarding the system. Rather than building an architecture from scratch, we thought implementing an objective, successful approach would be better for our project. The following image shows the overall architecture of ResNet50.

layer name	output size	18-layer	34-layer	50-layer	101-layer	152-layer
conv1	112×112	7×7, 64, stride 2				
	56×56	3×3 max pool, stride 2				
conv2_x		$ \left[\begin{array}{c} 3\times3,64\\3\times3,64 \end{array}\right]\times2 $	$\left[\begin{array}{c} 3\times3,64\\ 3\times3,64 \end{array}\right]\times3$	$ \begin{bmatrix} 1 \times 1, 64 \\ 3 \times 3, 64 \\ 1 \times 1, 256 \end{bmatrix} \times 3 $	$\begin{bmatrix} 1 \times 1, 64 \\ 3 \times 3, 64 \\ 1 \times 1, 256 \end{bmatrix} \times 3$	$   \begin{bmatrix}     1 \times 1, 64 \\     3 \times 3, 64 \\     1 \times 1, 256   \end{bmatrix} \times 3 $
conv3_x	28×28	$ \begin{bmatrix} 3 \times 3, 128 \\ 3 \times 3, 128 \end{bmatrix} \times 2 $	$ \begin{bmatrix} 3 \times 3, 128 \\ 3 \times 3, 128 \end{bmatrix} \times 4 $	$   \begin{bmatrix}     1 \times 1, 128 \\     3 \times 3, 128 \\     1 \times 1, 512   \end{bmatrix}   \times 4 $	$ \left[\begin{array}{c} 1 \times 1, 128 \\ 3 \times 3, 128 \\ 1 \times 1, 512 \end{array}\right] \times 4 $	$   \begin{bmatrix}     1 \times 1, 128 \\     3 \times 3, 128 \\     1 \times 1, 512   \end{bmatrix} \times 8 $
conv4_x	14×14	$\left[\begin{array}{c} 3\times3,256\\ 3\times3,256 \end{array}\right]\times2$	$ \begin{bmatrix} 3 \times 3, 256 \\ 3 \times 3, 256 \end{bmatrix} \times 6 $	$\begin{bmatrix} 1 \times 1, 256 \\ 3 \times 3, 256 \\ 1 \times 1, 1024 \end{bmatrix} \times 6$	$\begin{bmatrix} 1 \times 1, 256 \\ 3 \times 3, 256 \\ 1 \times 1, 1024 \end{bmatrix} \times 23$	$ \left[\begin{array}{c} 1 \times 1, 256 \\ 3 \times 3, 256 \\ 1 \times 1, 1024 \end{array}\right] \times 36 $
conv5_x	7×7	$\left[\begin{array}{c} 3\times3,512\\ 3\times3,512 \end{array}\right]\times2$	$\left[\begin{array}{c} 3\times3,512\\ 3\times3,512 \end{array}\right]\times3$	$   \begin{bmatrix}     1 \times 1, 512 \\     3 \times 3, 512 \\     1 \times 1, 2048   \end{bmatrix} \times 3 $	$ \left[\begin{array}{c} 1 \times 1, 512 \\ 3 \times 3, 512 \\ 1 \times 1, 2048 \end{array}\right] \times 3 $	$ \left[\begin{array}{c} 1 \times 1, 512 \\ 3 \times 3, 512 \\ 1 \times 1, 2048 \end{array}\right] \times 3 $
	1×1	average pool, 1000-d fc, softmax				
FLOPs		$1.8 \times 10^9$	$3.6 \times 10^9$	$3.8 \times 10^9$	$7.6 \times 10^9$	11.3×10 <sup>9</sup>

As we did not have a device with a compatible GPU with PyTorch's module, we used a standard device and its CPU to fit the model. We used Adam for the optimization function and set the number of epochs eight times. In the final epoch, the system displayed a validation accuracy of 0.9097.

The next step is to employ the image classification program for the Arduino board. We used an ESP-32 camera and Python's OpenCV module to detect the object. When the

object is seen in the camera, we implement the previous program that classifies the category of the garbage. The system outputs a number from zero to three, each representing the category.
